

"Reconnect for everyone!" - IDS peak Update 2.10

Unique security feature is now available for all uEye / uEye+ cameras

Some camera features will hopefully never be used. But how quickly voltage problems, power failures or cable problems can lead to a disconnection or reboot of the application camera.

It's helpful if the camera restarts seamlessly after such an event, retains all preset settings and behaves as if nothing had happened - fully automatically. We call this function "auto reconnect".

Even if the vision standard does not define this behavior, IDS customers benefit from this additional security! The "auto reconnect" ensures that your application can continue to use the IDS cameras in all scenarios without any problems and without you having to program them.

As we have integrated the function into the transport protocols, this unique security is now even available for uEye and uEye+ cameras with GigE Vision and USB3 Vision in third-party applications.

Further information on the release of IDS peak 2.10 including all other improvements can be found as usual in the latest release notes. IDS peak 2.10 is now available.
